Millennium EVO™ by Flow-Rite

What is Millennium EVO™?

The Millennium EVO™ battery watering system of flow-rite™ has been developed specifically for the industrial/commercial battery users. Originally developed for forklift batteries, the Millennium EVO™ system has evolved to fit the needs of many other applications such as ground support equipment, mining equipment, locomotives, sweepers, scrubbers, etc. The Millennium EVO™ system works by replacing existing vent caps through patented valves that are interconnected with tubing, allowing the user to fill all cells of the battery from a single remote location. Each valve independently shuts off water flow to the cell when the proper electrolyte level is reached, allowing the batteries to be filled perfectly every time without even having to look at the batteries.

Why Choose Millennium EVO™?

Millennium EVO™ is the most innovative, advanced, versatile, and user friendly system. At a glance, many of the features are evident: Everything from the clampless polypropylene tubing, flame arrestors, flip top cap, and the low profile to the solid shroud. But what's even more impressive is the structure inside the valve. This structure allows the Millennium EVO valve working independently of water pressure (works from 3 to 35 static psi), allowing you to use a variety of water supply options – high-pressure filling is also possible as gravity filling with just a single filling valve.
